C6 SAVIOR SHIELD

THE MULTI-THREAT SHIELD C6 SAVIOR MTS

Based on a request from our corporate clients concerned about Active Shooter mitigation and response, we developed the lightest, most discreet, affordable ballistic shield on the market.

The Covered 6 Savior Multi Threat Shield is perfect for tactical teams, executive protection, home defense and public safety first responders. The Savior MTS is designed to be versatile and effective against handgun shotgun, and rifle rounds.

The Savior's proprietary design allows the user to add a NIJ rifle rated plate (Lvl III) to provide more protection against higher level threats. With the custom 11×17 rifle plate inserted, the Savior only weighs 10 lbs!

The design also allows the user to let go of the shield and maintain protection while still having full use of hands for weapons manipulations, reloads and rescues.

FEATURES:

- Waterproof 1680 ballistic nylon
- NIJ rated ballistic materials level IIIA protection with optional Max III (rifle)
- Adjustable strap for "hands free" operation
- Utility pouch with attachments (sold separately) for handgun, Taser, etc...
- One piece "no crease" design
- Quick easy deployment
- Ultra discreet – low profile laptop case appearance
- Limited warranty
- Lightweight – 6.5 lbs for NIJ IIIA
- Training Packages available for Law Enforcement and Security Companies
- Call and check for availability. We will only sell to vetted buyers with a legitimate use for our product.

private security evolution

“It’s All About the Micro Experiences”

By Mike Grant
COO, Covered Six

The private security industry is evolving more rapidly than ever before as it faces the country’s challenges in securing both public and private interests. Because the mission of security now may involve much greater personal interaction with its clients and the people they serve, security officers should possess high emotional intelligence, patience, and empathy. The most effective and valued officers will understand that a concierge approach to their interactions will have far reaching positive effects.

Not only reacting to a client’s needs but anticipating what those needs might be will set a security company apart from all others. An example of this anticipatory behavior was exemplified recently by Covered Six Security Manager Guy Hartson who personally telephoned a resident in his area to advise them of a neighbors planned party that may affect their quality of life. Guy told me, “I feel that information sharing is a huge component of an effective, efficient workplace. The information sharing has to start at the bottom and go all the way to the top.” I received feedback from the resident who stated that she felt “special because the officer took the time to think of me and how the loud party might affect me, I really appreciated that”. I call this type of positive interaction a “micro experience” which is a short time duration experience that leaves a person with an immediate impression that they can have confidence in someone’s abilities and leaves them feeling really good.

Give enough of these micro experiences to your clients and eventually you have a lasting positive impression and confidence in your security company and your brand. It’s not always about catching a criminal or stopping criminal activity, sometimes the small things make the biggest difference. Just remember, it takes genuine empathy to make the micro experience real.

C6 AUGMENTED "TACTICAL" REALITY (A-TAC-R)

mixed reality training

"We are pioneering the next evolution of virtual reality training with MXR"

By Mike Grant
COO OF COVERED 6

Both officers' eyes carefully scan the debris-strewn alleyway as the partners cautiously move forward together. They received a radio call of shots fired and somebody screaming but nothing further. Working as a team, they continue, vigilantly searching, ignoring the beads of sweat rolling down their backs and the flies buzzing annoyingly around their heads. Suddenly, from behind a wrecked car, a man stands up, holding what appears to be a gun down by his side. Simultaneously, both officers feel adrenaline dumping into their bodies as one begins issuing commands to the suspect while the other provides cover. The man ignores them, smiles, and begins raising the gun in their direction.

What separates a real-life and death incident from a training scenario? Lack of fear and the physiological changes that take place in the human body come to mind. Unless officers train under these conditions, the correct responses displayed during training may not be reproduced in the real world. So the challenge is to reproduce a more realistic scenario that officers can negotiate and interact with in training, but most importantly, "lose themselves in" so that whatever they experience becomes "real," producing some fear and physiological changes.

Great strides have been made to create reality-based training (RBT), including virtual reality (VR), which unfortunately offers very little true sensory feedback or proprioceptor orientation. Many officers complain about experiencing vertigo, disorientation, and eye strain. Some departments have nicknamed their VR systems the "Barforama." These unintended byproducts take the officer out of the immersion and cause unrealistic distractions. These systems are cumbersome as the officer is tethered to equipment, making movement difficult. VR training is usually confined to a closed space training room which further separates the officer from the reality of the streets.

“We are pioneering the next evolution of virtual reality training with MXR”

With the need for officers to train in a “real world” environment, in steps Covered 6’s “mixed reality” technology (MXR). Blending real and virtual worlds, Covered 6’s mixed reality MXR technology produces an intensive new environment where virtual objects exist and interact in a real-time reality. High-tech reality-based advancements result from extensive progress in processing power, display technology, and graphical input systems.

MXR interweaves real and virtual worlds, giving users an accurate 3D account of virtual and real objects around them. It continually transforms the user’s perception of the real-world scenario as they travel through an actual space, untethered to any cumbersome equipment. An MXR system can be used anywhere, at any time, allowing the officer to escape the confines of a training room and move around naturally. This technology does not require a fixed space for a simulator or its training environments, making MXR training a highly cost-effective solution. In addition, MXR can involve a partner or team interaction training simultaneously. Training with real partners, not avatars, adds another level of realism not achieved with VR.

Using this technology, MXR at Covered 6 eclipses traditional simulated tactical training. Instead, its immersive applications give users the complete experiential training that emulates reality, including situational awareness, stress inoculation, and other stimulation to test decision-making skills and reaction time. “We are pioneering the next evolution of virtual reality training with MXR,” explained Chris Dunn, CEO and Founder of Covered 6, “MXR will radically increase portability, training versatility, and performance and programming for law enforcement, the military, and other agencies.”

Covered 6’s MXR platform rivals that of leading technology suppliers in this vertical, one of which is a branch of the U.S. military recently awarded a contract to customize its augmented reality product for their training. The contract is worth billions over a decade. Covered 6 holds multiple patents for innovative MXR applications in the cyber and drone industries and various public safety industries, including law enforcement and fire.

The power of training with MXR is evident; the future of MXR is imminent: “My vision for The C6 MXR program is to bring the latest tech advantages to the first responder industry,” said Mr. Dunn.
